

LINEAR MOTORS P10-54X180U

- ✓ 230VAC and 3 x 400VAC technology
- ✓ Peak forces up to 502 N
- ✓ LinMot encoder or 3rd party drive encoder
SinCos, A/B incremental, BiSS / PT1000, PTC
- ✓ Extremely high dynamic
- ✓ Rotating push-pull TWIN connector for power and encoder cables
- ✓ Can also be controlled by standard third-party servo drives

SIN/COS-POSITIONS-FEEDBACK (D0X-INTERFACE FOR 3RD PARTY DRIVES)

The linear motors of the P10-54 series have a contactless, integrated position feedback, which means that an external encoder is not required. The integrated position sensor technology of the motors with D0x interface provides a differential standard 1Vpp sin/cos signal with a 60mm period. The phase position of the sensor signals and the phase currents (with constant force in positive direction) is shown on the right side of the diagram. (The Sin encoder signal is in phase with the current characteristic of phase U).

The arrows show the direction of movement of the slider. The stator remains in its position.

TEMPERATURE FEEDBACK DX4 / DX5

Overheating protection is provided by three internal thermistors embedded in the motor windings. These thermistors are monitored by the motor electronics. A single thermistor is tracked based on the maximum of the temperature readings. This is done to accurately monitor the temperature along the entire length of the stator and to react as quickly as possible to dynamic changes in a single motor phase. When the motor winding temperature reaches its absolute maximum value, the drive amplifier/servo controller must shut down the motor to protect the motor from overheating dam-

age. To support the temperature evaluation given by the drive amplifier/servocontroller, the various temperature interfaces -Dx4 or -Dx5 are available. Depending on the interface used and the signals used, there are suitable motor cables (see overview table, section Accessories/Motor cables).

Dx4 (Pt1000 dual)

An emulated **Pt1000 thermistor** is available on both the **signal and the power connector** for evaluating the max. motor temperature.

Dx5 (PTC dual)

An emulated **PTC thermistor** is available on both **the signal and the power connector**, which changes to the high-impedance state when the max. motor temperature is exceeded.

A/B INCREMENTAL POSITION FEEDBACK (D2X- INTERFACE FOR 3RD PARTY DRIVES)

The linear motors of the P10-54 series have a contactless, integrated position feedback, which means that an external encoder is not required.

The position output of the motors with D2x interface is an industry-standard A/B incremental signal with supplementary reference signal (RS422). Hall switch signals are available for commutation. The relationship between the phase current and the position sensor output is shown on the right.

The arrows show the direction of movement of the slider. The stator remains in its position.

Example:

Min. pulse interval $t = 500 \text{ ns}$

For downstream evaluation, at least the following counter frequency is required:

$$f_{\text{counter}} = 1 / \text{pulse interval} \\ = 1 / 500 \text{ ns} = 2 \text{ MHz}$$

The logical state of signals A and B is not defined in relation to the reference signal Ref. The signal shape may differ from the illustration.

TEMPERATURE FEEDBACK DX4 / DX5 / DX6

Overheating protection is provided by three internal thermistors embedded in the motor windings. These thermistors are monitored by the motor electronics. A single thermistor is replicated based on the maximum of the temperature readings. This is done to accurately monitor the temperature along the entire length of the stator and to react as quickly as possible to dynamic changes in a single motor phase. Dx5 (PTC dual)

An emulated **PTC thermistor** is available on both the **signal and the power connector**, which changes to the high-impedance state when the max. motor temperature is exceeded.

Dx6 (PTC)

An emulated PTC thermistor is available on the **signal connector**, which changes to the high-impedance state when the max. motor temperature is exceeded. The emulated **PTC** is internally **connected to GND on one side**, which is why only one additional signal line is connected to the servocontroller in addition to the power supply for evaluation.

BISS-C POSITION FEEDBACK (D3x- INTERFACE FOR 3RD PARTY DRIVES)

The linear motors of the P10-54 series have contactless, integrated position feedback, which means that there is no need for an external encoder.

The position feedback of the motors with D3x interface is based on RS422 and the industry-standard BiSS-C protocol. Either the transmitted position or the hall switch signals can be used for commutation. The relationship between the phase current and the encoder signals is shown on the right.

Commutation Angle

$$\text{Commutation Angle} = (\text{Position mod magnetic Period}) \cdot \frac{360^\circ}{\text{Magnetic Period}}$$

First, the position data is reduced to the range within a magnetic period using modulo. This relative position value is then converted into an electrical angle.

BISS-C-FRAME DESCRIPTION

Singleturn Position 34 Bit: D33-D0

Binary coded, MSB first
 Resolution per bit = 1 μ m
 After switching on the encoder, the position starts with an offset of 3 m. In addition to the offset, the current position angle of the slider within a pole pair (magnetic period) of the motor is added to this. This position can be used for commutation.

Errorbit: nER

0: error; 1: no error (active low).
 Indicates an encoder error. If this bit indicates an error, the position must be treated as invalid.

Warnbit: nWA

0: warning; 1: no warning (active low).
 Displays encoder warnings. The position is still valid if only a warning is displayed.

CRC 6 Bit: CRC5-0

Polynomial : 0x43
 Initial value : 0x00
 The CRC is calculated via position, error and warning bits. It is transmitted with MSB first and inverted. The start bit and the "0" bit are omitted from the CRC calculation.

Register and Memory Definitions

A description of how a BiSS-C master can access registers can be found at www.biss-interface.com.

BiSS-C - XML

The encoder is compatible with the "Standard Encoder Profile (BP3)". The function of the XML file is to automatically assign device properties in the master using the BiSS identifier. The XML file can be used by masters to facilitate the configuration of slave devices. It can be downloaded from www.linmot.com.
